

ABSTRACT OF THE DISCLOSURE:

There is disclosed a device for connecting movable parts with structural components of airplanes or the like, including at least one fitting provided with at least one bearing. In order provide such a device exhibiting low thermal stresses, a low weight, a high bearing capacity and a producibility as simple as possible, it is provided that the at least one fitting is made of a synthetic material and glued with the movable part. The resin transfer molding (RTM)-method is particularly suitable to produce the fitting.
